

A look-back on Jan Stochel's research, including his early work

Palle Jorgensen

June 2022

The talk offers a look-back perspective on early papers by Jan Stochel's (including joint with Franek Szafraniec). With a focus on dilation constructions, unbounded operators and subnormality. This is part of a fantastic and larger research record of Jan Stochel. I don't aim to cover all of Jan's works but will offer instead a perspective on the early period. The present speaker is included in the list of many researchers who also explored algebras of unbounded operators as they arise in diverse areas of pure and applied mathematics, and going back to the same period.
